# Verification of Accuracy Improvement for CoMPACT Monitor Due to Suboptimal Inter-probe Time

Kohei Watabe

Graduate School of System Design,  
Tokyo Metropolitan University

July 22, 2009

# Background (1)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

## Change of recent Internet

- The Internet plays an important role as infrastructure
- Various applications provide new services
- The Internet is used not only as a private tool but also a business tool

Internet service providers (ISP) need a measurement technology to produce **per-flow QoS** information. (e.g. one-way delay for each flow)

# Background (2)

Tokyo Metropolitan  
University  
Kohei Watabe

- Conventional means of measuring one-way delay can be classified into passive and active measurements

## Passive measurement

- It monitors the target user packet directly by capturing the packets
- It can get accurate one-way delay for each flow
- One-point monitoring to measure volume of traffic can be conducted very easily
- Two-point monitoring to measure one-way delay lacks scalability

## Active measurement

# Background (3)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

## Traditional method

- Passive measurement has scalability problem
- Active measurement can not measure per-flow one-way delay

In large-scale network, **we can not get per-flow one-way delay** by using traditional method.

# The objective (1)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

We have proposed **change-of-measure-based passive/active monitoring** (CoMPACT monitor) that achieves scalable measurement of one-way delay distribution for each flow.

+

Study of F.Baccelli

- Study about inter-probe time for active measurement
- Suboptimal probing in terms of accuracy was proposed

||

In this study, we have applied this suboptimal probing to CoMPACT monitor and tried to **improve CoMPACT monitor in accuracy**.

# CoMPACT monitor (1)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- If arrival timing is different, packet delay is different

- In probe packets, 2 packets of 10 packets arrive in congestion
- In target packets, 4 packets of 10 packets arrive in congestion
- CoMPACT monitor transfer probe packets delay into target packets delay according to density of target packets

# CoMPACT monitor (2)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- Estimator of one-way delay distribution by CoMPACT monitor
- It estimate the probability for target packet delay to exceed  $c$

$m$  : Number of probe packets

$T_n$  : Arrival time of  $n$ th probe packet

$V(t)$  : Virtual one-way delay

$a(t)$  : Volume of traffic of target flow

$$\underbrace{\frac{1}{m} \sum_{n=1}^m 1_{\{V(T_n) > c\}}}_{\text{Delay of probe packet (Active)}} \underbrace{\frac{a(T_n)}{\sum_{l=1}^m a(T_l) / m}}_{\text{Translation (Passive)}}$$

- Passive measurement to measure traffic has not scalability problem

# Suboptimal probing (1)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- Intervals with an exponential distribution have been widely used as probe packets arrivals  
(Probing method according to PASTA property)
- This is the only appropriate method if we can not ignore the effect of probe packets

---

## Assumption

- We can ignore the effect of probe packets

- PASTA-based probing is not the only method
- Some other probing method can estimate true value  
(e.g. Intervals with a uniform or Gamma distribution etc.)

# Suboptimal probing (2)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

## Assumption

- The autocovariance function of the target process is convex

- Periodic-probing achieves minimum variance of the estimator
- A lower variance is connected with accuracy
- If the autocovariance function is convex, periodic-probing is optimal in accuracy

when the cycle of the target process corresponds to the cycle of the probe packet, a **phase-lock phenomenon** occurs and the estimator may converge on a false value.

# Suboptimal probing (3)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- To solve the tradeoff, intervals with the parameterized Gamma distribution is proposed
- When  $\beta = 1$ , it corresponds to exponential distribution
- When  $\beta \rightarrow \infty$ , it converges on determinate value

## Property of this Gamma-probing

This Gamma-probing links PASTA-based probing with periodic-probing continuously.

- Variance decreases with increase of  $\beta$
- Phase-lock occurs when  $\beta$  is so large
- We can get a suboptimal probing if we tune appropriate  $\beta$

# Simulation (1)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- We investigated the effectiveness of Gamma-probing for CoMPACT monitor through simulations
- Each end host on the left side transfers packets by UDP to the corresponding destination end host on the right side

# Simulation (2)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- User flows are given as ON/OFF processes and categorized into the 4 types
- Probe packet trains are categorized into the 5 types listed in the following table

Distribution of probe intervals	Parameter of Gamma distribution	Mean probe intervals
Exponential	$(\beta = 1)$	0.5 s
Gamma	$\beta = 5$	0.5 s
Gamma	$\beta = 25$	0.5 s
Gamma	$\beta = 125$	0.5 s
Periodic	$(\beta \rightarrow \infty)$	0.5 s

- Parameters of Exponential and Periodic are parameters of the Gamma distribution corresponding to each probing

# Simulation (3)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- The result of estimation by CoMPACT monitor with Gamma-probing
- Parameter  $\beta$  of Gamma-probing is 25

# Simulation (4)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

■ We have plotted for other parameters and gotten similar results

# Simulation (5)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- We were able to confirm that the CoMPACT monitor with Gamma-probing gives good estimates
- We cannot judge the superiority or inferiority of any parameter
- To judge the superiority or inferiority, we should investigate variance of estimator

# Simulation (6)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

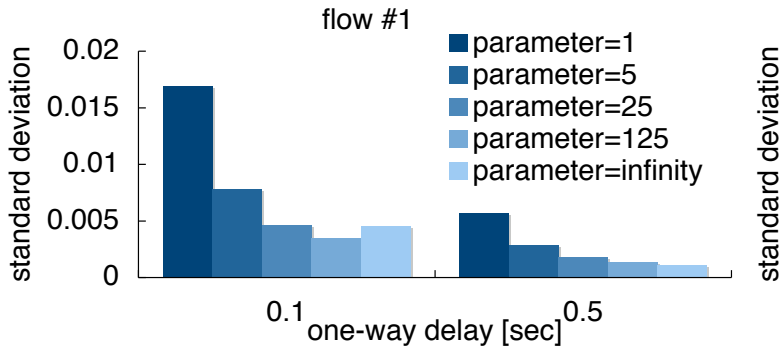

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- We show the standard deviation of estimator
- A case of flow #1
- A case of flow #11

# Simulation (7)

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

- The standard deviation clearly decreases as  $\beta$  increases from  $\beta = 1$  to  $\beta = 125$
- In result of flow #1, the standard deviation of periodic-probing is larger than that for  $\beta = 125$
- This reversal may be a sign of incorrectness due to the phase-lock
- If we tune appropriate parameter  $\beta$ , we can get more accurate estimation than traditional PASTA-based probing

# Conclusion

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

It was confirmed that **Gamma-probing is effective** when the complementary CDF of one-way delay was estimated by CoMPACT monitor.

- the convexity of the autocovariance function of the target process requires special attention

## Residual issues

- We should present the method to determine appropriate parameter
- Application should be verified about not only one-way delay but also packet loss

Tokyo Metropolitan  
University

Kohei Watabe

Background

The objective

CoMPACT monitor

Suboptimal probing

Simulation

Conclusion

Thank you very much for your kind attention
